Documentation

The 'Similar Title Movie Recommender' is a content-based recommender of movies for finding movies with similar title. The tech stack used is the MERN stack, which is Mongo DB for database, Express backend, React frontend and Node.js. It uses a javascript library called content-based-recommender to recommend similar titles. The dataset used is a dataset from Kaggle called "Wikipedia Movie Plots."

<https://www.kaggle.com/datasets/jrobischon/wikipedia-movie-plots?resource=download>

The original plan for this project was to include movie plots to the recommendation, unfortunately, the library I had used was not equipped to handle large dataset. The plot can possibly be added in the future to provide the user a better user experience.
